What component causes a flow to run after a record has been created or updated?

- A. Date-based trigger
- B. Record-based trigger
- C. On-change trigger
- D. Application-based trigger
- E. Updated-date trigger

Answer: B

Explanation:

A record-based trigger is a component that causes a flow to run after a record has been created or updated in a specified table¹. It allows users to define conditions and actions for the flow based on the record's state and values¹. For example, a record-based trigger can start a flow when a new incident is created or when an existing incident is updated with a certain priority¹.

Which field on every record contains a unique identifier for that record?

- A. sys_number
- B. sc_req_item
- C. sys_id
- D. sys_number_id

Answer: C

Explanation: Detailed Explanation: In ServiceNow, the sys_id field serves as a unique identifier for every record within the platform's database. The sys_id is a 32-character globally unique identifier (GUID) that ServiceNow automatically generates for each record, ensuring that every record is uniquely identifiable and can be referenced across the system. This sys_id is essential for integrations, queries, and relationships between records. (Reference: ServiceNow Documentation - Record Identification and sys_id Field)

Answer: D

275. - (Topic 3)

A manager is complaining that they can't get the data they need on a report because the data resides in two different tables. This data is used for many different reports in their department. You have checked to see if

dot-walking will meet the requirement, and it is not possible. What else might you try to help this manager?

- A. Create a custom table
- B. Create a Report Template
- C. Create a Database View
- D. Export the tables to a spreadsheet
- E. Create a Report Source

Answer: C

Explanation: Detailed Explanation: In ServiceNow, when reporting data is required from multiple tables and dot-walking isn't feasible, creating a Database View is often the best approach. A Database View allows joining multiple tables virtually without creating new records, making it highly efficient for reporting. This view can then be used as a data source for reports, pulling information across tables without physically combining data. According to ServiceNow documentation, this is especially useful for creating complex reports that rely on data relationships across tables without altering the underlying data structure.

Which script can run when a record is displayed, inserted, updated, deleted, or when a table is queried?

- A. Business Rule
- B. Client Script
- C. Record Rule
- D. UI Script
- E. Scheduled Job

Answer: A

Explanation: Detailed Explanation: Business Rules in ServiceNow are server-side scripts that execute in response to database operations, such as when a record is displayed, inserted, updated, deleted, or queried. They are critical for automating processes, ensuring data integrity, and performing backend operations without user intervention. Business Rules can be set to run at different times, such as before or after the database action, depending on the requirement. Which tables are children of the Task table and come with the base system? Choose 3 answers

- A. Incident
- B. Problem
- C. Change Request
- D. Config
- E. Dictionary
- F. cmdb

Answer: A,B,C

Explanation: The Task table is a base table in ServiceNow, which means it is not extended from any other table. However, other tables can extend the Task table to inherit its fields and functionalities. Incident, Problem, and Change Request are all child tables of the Task table, meaning they inherit the fields and functionalities of the Task table and add their own specific fields and functionalities.

What type of table has a name starting with u_ or x_?

- A. Custom table
- B. Parent table
- C. Core table
- D. Base table

Answer: A

Explanation: Detailed Explanation: In ServiceNow, tables with names that start with u_ or x_ are Custom Tables. The prefix u_ is automatically assigned to custom tables created within a ServiceNow instance to distinguish them from core (standard) tables. Tables with the x_ prefix indicate they are custom tables associated with a scoped application, created within a ServiceNow application scope. Custom tables are crucial for extending ServiceNow's functionality and tailoring applications to meet specific business requirements. Answer: A

Explanation:

Update sets are the configuration changes made in an instance, such as changes in a form, that can be exported from one instance and imported into another. This helps to implement the changes from the Dev environment to another environment, such as Test or Prod. Update sets capture the changes made to system properties, UI actions, business rules, workflows, and other customizations.

An administrator creates "customer_table_admin" and "customer_table_user" roles for the newly created "Customer Table". Which ACL rule would grant access to all rows and all fields to both the customer_table_admin and customer_table_user roles?

- A. customer.all
- B. customer.*
- C. customer.field
- D. customer.none

Answer: B

Explanation:

The customer.* ACL rule would grant access to all rows and all fields to both the customer_table_admin and customer_table_user roles because it uses a wildcard (*) to match any operation on the customer table. The other options are either too restrictive or too broad.

What are the benefits of building flows using Flow Designer? Choose 3 answers

- A. Supports easy integration with 3rd party systems
- B. Provides IDE for complicated scripting
- C. Provides natural-language descriptions of flow logic
- D. Supports No-Code application development
- E. Automatically populates SLA records
- F. Provides built-in libraries /API for complex coding

Answer: A,C,D

Explanation:

The following are the benefits of building flows using Flow Designer:

- ☞ C. Provides natural-language descriptions of flow logic: This allows users without programming experience to understand and modify flows, making them more accessible to a wider range of users.
- ☞ D. Supports No-Code application development: Flow Designer provides a visual interface and pre-built actions that allow users to automate processes without writing code. This can significantly reduce development time and effort.
- ☞ A. Supports easy integration with 3rd party systems: Flow Designer integrates with a variety of 3rd party systems through the Integration Hub, making it easy to connect your ServiceNow instance to external applications.

Flow Designer offers a low-code/no-code approach to building automation, simplifies complex logic with natural language descriptions, and integrates seamlessly with external systems.

A customer wants to be able to identify and track components of their infrastructure that support their ecommerce service. What ServiceNow products could support this requirement?

Choose 3 answers

- A. Performance Analytics
- B. Configuration Management (CMDB)
- C. Financial Management
- D. Discovery
- E. Service Mapping

Answer: B,D,E

Explanation: Configuration Management (CMDB) is a product that allows users to identify and track components of their infrastructure, such as servers, applications, databases, networks, and devices, and their relationships¹. CMDB provides a single source of truth for IT assets and services, and supports IT service management processes¹.

Discovery is a product that automatically scans the network and populates the CMDB with the discovered infrastructure components and their attributes². Discovery uses probes, sensors, and patterns to identify and classify IT assets, and updates the CMDB with any changes².

Service Mapping is a product that creates a top-down view of the infrastructure components that support a specific business service, such as ecommerce³. Service Mapping uses discovery data and application traffic analysis to map the dependencies and relationships between IT assets and services, and displays them in a graphical interface³. References
